BugFlow Product Site - Midterm Project Peer Review Reflection

Name: Enmanuel Morillo

Date: October 27, 2026

Course: CSC 271

1. Content & Audience

1. Did your peers clearly understand your site's purpose and target audience?

Yes, my reviewer understood what my website was about pretty well. They mentioned that the purpose of BugFlow was very clear and that the home page does a good job explaining it. They described BugFlow as a website that helps people who aren't very technical report bugs in software, which is exactly what I was going for. One thing I noticed was that they thought users could comment on other people's reports and offer solutions, which isn't really something my website does. I think I could make it a little more clear that BugFlow is meant to help users organize their problems into bug reports that developers can understand.

2. What suggestions did they make to improve your site's content or messaging?

Most of the feedback I got about my content was positive. My reviewer liked that I included examples of bug reports because it helps users understand what a good report should look like. One of the main issues they pointed out was from the Lighthouse SEO audit, where I scored a 91. They mentioned that my pages were missing meta tags, which could affect how my website shows up on search engines. Since then I've gone back and added meta descriptions and Open

Graph tags to my pages. I also added keywords like "bug report generator" and "bug report examples" throughout the website to help improve the SEO.

2. Design & User Experience

3. How did your peers respond to your site's design (layout, color, typography, or organization)?

My reviewer had mostly good things to say about the design of my website. They liked the colors I used and mentioned that they helped certain buttons stand out, like the Home button, Report a Bug button and Learn More section. They also said that BugFlow was a good and memorable name. Almost everything in the style section of the rubric was marked Excellent except for the mobile responsiveness, which was marked Needs Improvement.

They did give me a few suggestions that I think would make the website look better. For example, they said I should use less padding on the sides because some of the content looks a little too compressed. They also suggested making the heading section smaller on the Report a Bug page so the actual form has more room. Another thing they noticed was that the video on my Examples page wasn't centered correctly. They also thought the "Why BugFlow?" section could use more styling because the list looked a little plain compared to the rest of the website.

4. Did they find the design effective in communicating your message and engaging users?

Yes, overall they thought the design worked well and communicated the purpose of BugFlow. They said that the layout and styling were pretty good and only needed a few adjustments. The biggest issue they noticed was that some of my images weren't loading on the live version of my website. Because of this, some of the pages looked more empty than they were supposed to. I

agree with this because the images are a big part of making the website look complete and once I fix them I think the website will look a lot better.

3. Functionality & Performance

5. What issues did your peers identify with features or interactivity on your site?

The biggest problem my reviewer found was that my images weren't showing up on my live website at enmanuelmorillo.rhody.dev. This was a little confusing because everything was working correctly when I tested the website locally. Other than that, most of the features were working fine. My navigation links, email link, form, table and embedded video were all working properly. They also tested my HTML and CSS using validators and didn't find any errors. The only other small issue they mentioned was that the video on the Examples page wasn't centered.

6. Did they note any pages or elements that loaded slowly or inconsistently across devices or browsers?

My reviewer didn't notice any major problems with loading times. The website actually scored pretty well on Lighthouse with a 96 for Performance, 93 for Accessibility, 96 for Best Practices and 91 for SEO. They also tested the website using Chrome and Brave and didn't notice any differences between the two browsers.

The biggest problem was how the website looked on different screen sizes. They mentioned that the Examples page looked fine on mobile devices but the Home and Report a Bug pages didn't really adjust properly to smaller screens. This is something I definitely need to work on because I want people to be able to use BugFlow on their phones just as easily as they would on a computer.

4. Accessibility & Usability

7. What feedback did you receive about accessibility (e.g., alt text, color contrast, keyboard navigation)?

For accessibility my reviewer said the website was doing pretty good overall. They mentioned that the keyboard navigation worked, the colors had enough contrast and my images included alt text. My Lighthouse accessibility score was also a 93 which I think is pretty good, but theres still room for improvement.

One issue Lighthouse found was that some of my links only use color to stand out from regular text. This could make it harder for people who are colorblind to tell whats clickable. Another issue came from the WAVE accessibility tool, which found one redundant link. Basically my logo and Home button are right next to each other and they both take users to the same page. This isn't a huge issue but it could be annoying for people using screen readers.

8. What can you improve to make your site more inclusive and user-friendly?

I think theres a few things I can improve to make BugFlow more accessible. First I want to make sure that links inside my paragraphs are underlined so users can tell they're links without having to rely on color. I also want to fix the redundant link issue by making the logo a regular image when users are already on the home page.

Another important improvement is making the website more responsive. Right now some of the pages don't adjust correctly on smaller screens, which could make it difficult for someone using their phone to navigate the website or fill out a bug report. I also think adding captions or a small description under the YouTube video would be helpful for users who have hearing difficulties.

5. Action Plan

9. What did your peers like most about your site?

My reviewer really liked the overall idea behind BugFlow. They thought it was a useful concept and said the home page explained the purpose clearly. They also liked the color choices and thought the name BugFlow was memorable. One thing they specifically pointed out was the Examples page because it shows users what a good bug report should look like instead of just explaining it. They said it was a really good idea that helps the user, which I was happy to hear because that was one of the main reasons I included that page. Every item in the Content section of my rubric was marked Excellent.

10. What two improvements will you make based on their feedback, and how will you implement them?

The first improvement I'm going to make is fixing the images that aren't loading on my live website. Since everything works when I run the website locally, I think the problem has something to do with how the image files were uploaded to the server or how they're being referenced in my HTML. I plan on going into cPanel File Manager and checking that my images folder is uploaded to the correct location inside my product_site directory. I'm also going to check the file names because I know that capitalization matters on the server. For example, BugFlow.png and bugflow.png might be treated as two different files. Once I fix the file paths I'm going to go through every page on the live website and make sure all the images are showing up correctly.

The second improvement I want to focus on is making my website more responsive and mobile-friendly. This was the only section of the style rubric where I received Needs Improvement, so I think its important that I fix it. I'm planning on using CSS media queries in my styles.css file to make certain sec
